Abstract.

ABSTRACT

A cable/tube installation system for fixedly attaching one end of a cable to a operating head and another end of the cable to a stationary part of an apparatus. The system includes a drive pulley; a guide belt; and a guide member placed substantially in parallel with the guide belt between the drive and the driven pulley. Further, a part of the guide belt that is always in contact with the drive pulley when the head rotates is configured to be fixedly attached to the one end of the cable, is configured to be fixedly attached to the another end of the cable, thereby allowing the cable to be bent in a U shape at a midpoint, and to extend along the guide belt on one side and along the guide member on the other side.
